

EXPERIMENT 5:

AIM:

To perform word stemming on a list of words using the Porter Stemmer algorithm in Python.

PROGRAM:

```
from nltk.stem import PorterStemmer

ps = PorterStemmer()

words = ["playing", "running", "studies", "walking", "jumped"]

for word in words:

    print(word, "->", ps.stem(word))
```

OUTPUT:

The screenshot shows a Python IDE window titled 'IDLE Shell 3.13.5'. The main window displays the output of the program, which is a list of words and their stemmed forms: 'playing -> play', 'running -> run', 'studies -> studi', 'walking -> walk', and 'jumped -> jump'. A smaller window titled 'exp 5.py - C:/Users/chaith/Downloads/exp 5.py (3.13.5)' is also open, showing the source code of the program. The code imports the PorterStemmer class from the nltk.stem module, creates a PorterStemmer object, and then iterates over a list of words, printing each word and its stemmed form.

```
Python 3.13.5 (tags/v3.13.5:6cb20a2, Jun 11 2025, 16:15:46) [MSC v.1943 64 bit (AMD64)] on win32
