

EXPERIMENT 10:

AIM:

To implement transformation-based tagging using simple transformation rules in Python.

PROGRAM:

```
words = ["running", "cats", "quickly"]
```

```
for word in words:
```

```
    tag = "NN" # Initial tag (Noun)
```

```
    if word.endswith("ing"):
```

```
        tag = "VB"
```

```
    elif word.endswith("ly"):
```

```
        tag = "RB"
```

```
    print(word, ":", tag)
```

OUTPUT:

The screenshot displays a Python IDE with two windows. The background window is a terminal showing the output of a Python script. The foreground window is a code editor showing the source code of the script. The code defines a list of words and iterates through them, assigning a part-of-speech tag based on specific suffixes. The output shows the words 'running', 'cats', and 'quickly' with their respective tags 'VB', 'NN', and 'RB'.

```
Python 3.13.5 (tags/v3.13.5:6cb20a2, Jun 11 2025, 16:15:46) [MSC v.1943 64 bit (AMD64)] on win32
