

EXPERIMENT 23:

AIM:

To evaluate coherence of a text.

PROGRAM:

```
text = input("Enter text: ")
```

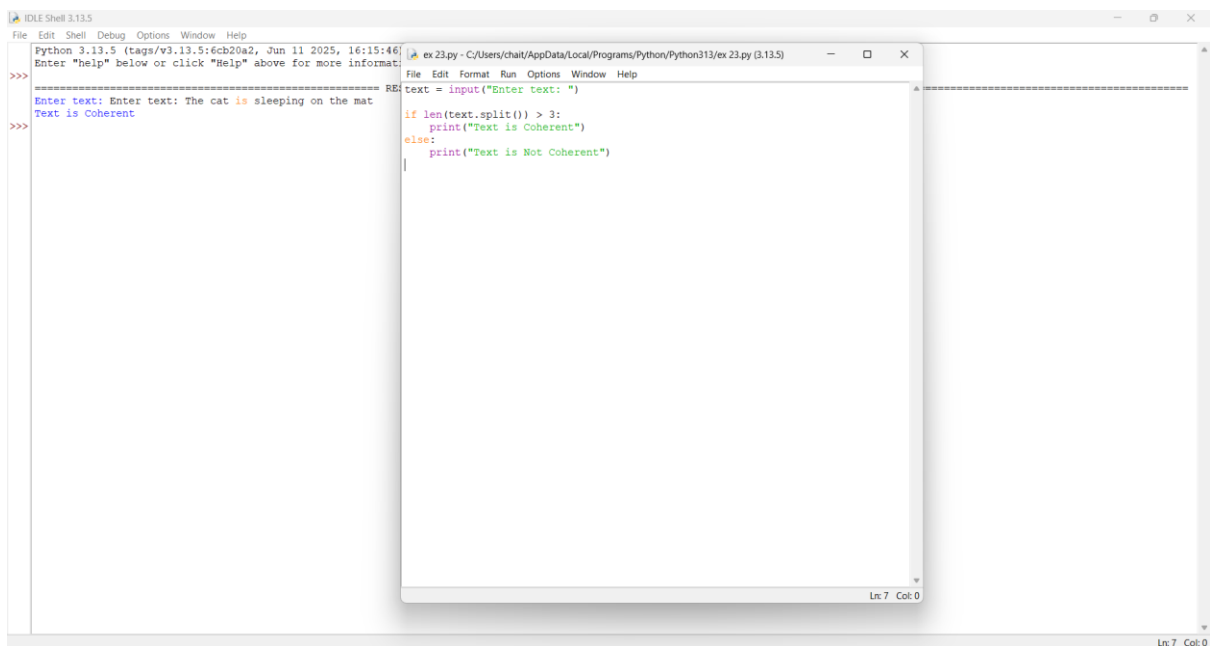

```
if len(text.split()) > 3:
```

```
    print("Text is Coherent")
```

```
else:
```

```
    print("Text is Not Coherent")
```

OUTPUT:

The screenshot displays two windows from the Python IDLE 3.13.5 environment. The 'Shell' window on the left shows the program's execution: it prompts 'Enter text: ', receives the input 'The cat is sleeping on the mat', and outputs 'Text is Coherent'. The 'Editor' window on the right shows the source code of the program, which uses the `len(text.split()) > 3` condition to determine coherence. The code is as follows:

```
text = input("Enter text: ")
if len(text.split()) > 3:
    print("Text is Coherent")
else:
    print("Text is Not Coherent")
```
