

EXPERIMENT 24:

AIM:

To identify dialog acts in a conversation.

PROGRAM:

```
sentence = input("Enter sentence: ")
```

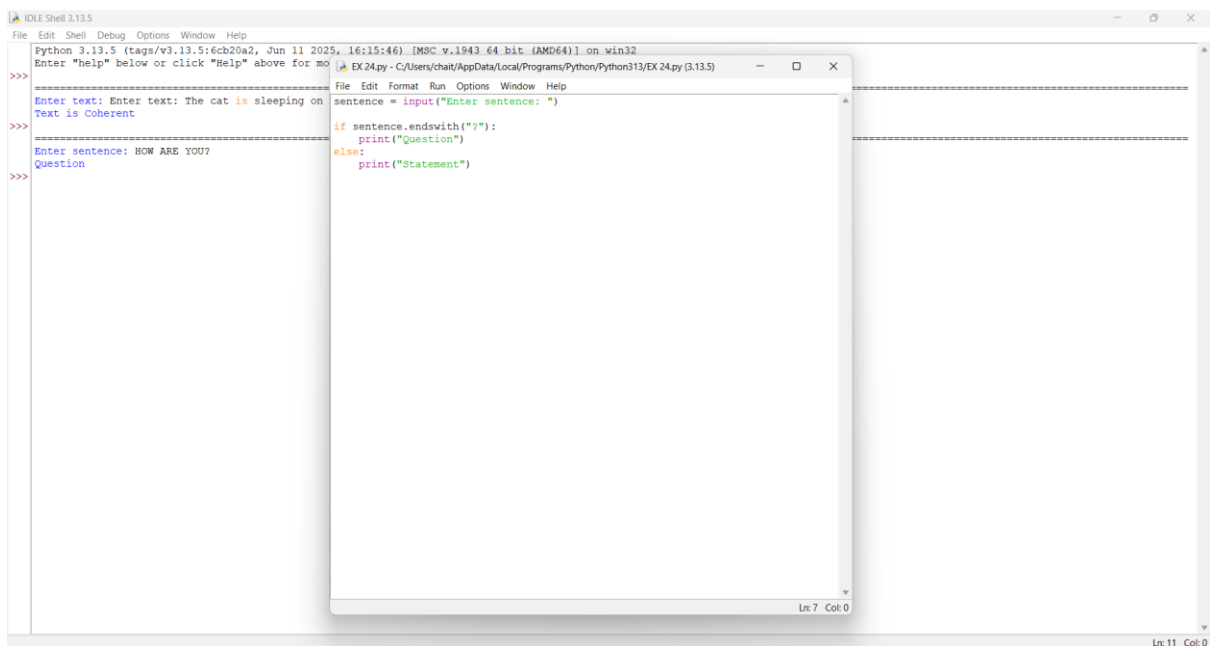

```
if sentence.endswith("?"):
```

```
    print("Question")
```

```
else:
```

```
    print("Statement")
```

OUTPUT:

The screenshot displays a Python IDE window titled 'IDLE Shell 3.13.5'. The main window shows the execution of a Python script. The script prompts the user to 'Enter sentence: ' and the user has entered 'HOW ARE YOU?'. The program has identified this as a 'Question' because it ends with a question mark. A smaller window titled 'EX24.py' is also visible, showing the source code of the program. The code defines a variable 'sentence' with the input 'Enter sentence: ', and uses an if-else statement to check if the sentence ends with a question mark. If it does, it prints 'Question'; otherwise, it prints 'Statement'.

```
Python 3.13.5 (tags/v3.13.5:6cb20a2, Jun 11 2025, 16:15:46) [MSC v.1943 64 bit (AMD64)] on win32
